Preface

This report of statistical findings describes the classification of ovarian cancer histotypes using data from NanoString CodeSets.

Marina Pavanello conducted the initial exploratory data analysis, Cathy Tang implemented class imbalance techniques, Derek Chiu conducted the normalization and statistical analysis, and Aline Talhouk lead the project.

1. Introduction

Ovarian cancer has five major histotypes: high-grade serous carcinoma (HGSC), low-grade serous carcinoma (LGSC), endometrioid carcinoma (ENOC), mucinous carcinoma (MUC), and clear cell carcinoma (CCOC). A common problem with classifying these histotypes is that there is a class imbalance issue. HGSC dominates the distribution, commonly accounting for 70% of cases in many patient cohorts, while the other four histotypes are spread over the rest of the cases.

In the NanoString CodeSets, we also run into a problem with trying to find suitable control pools to normalize the gene expression. For prospective NanoString runs, the pools can be specifically chosen, but for retrospective runs, we have to utilize a combination of common samples and common genes as references for normalization.

The supervised learning is performed under a consensus framework: we consider various classification algorithms and use evaluation metrics to help make decisions of which methods to carry forward for downstream analysis.

2. Methods

2.1 Data Processing

RNA was extracted from FFPE ovarian carcinoma samples and expression was quantified using NanoString nCounter. Samples were run in three CodeSets. Some samples or pools of samples were repeated across CodeSets for expression normalization. Normalizing CS2 to CS3 can easily follow the PrOType method for HGSC subtypes because both CodeSets have pool samples. A different technique is implemented when normalizing across CS1, CS2, and CS3 where we use common samples and genes as reference sets.

2.1.1 Raw Data

NanoString CodeSets contained a mix of all probes of interest, six positive controls spiked-in at fixed proportional concentrations (0.125- 128 fM), and eight negative controls (probes without a corresponding target). Gene targets also included 5 housekeeping genes: POLR1B, SDHA, PGK1, ACTB, RPL19. Gene selection was made from top ranked differential gene expression analysis between ovarian cancer histotypes and molecular subtypes of HGSC, as well as containing some genes of interest from unrelated projects. Gene targets in each subsequent CodeSet were re-curated, where non-informative genes were dropped and new potential differentiating genes were added.

There are 3 NanoString CodeSets:

```
• CS1: OvCa2103_C953
```

- Samples = 412
- Genes = 275
- CS2: PrOTYPE2_v2_C1645
 - Samples = 1223
 - Genes = 384
- CS3: OTTA2014_C2822
 - Samples = 5424
 - Genes = 532

These datasets contain raw counts extracted straight from NanoString RCC files.

2.1.2 Housekeeping Genes

The first normalization step is to normalize all endogenous genes to housekeeping genes (POLR1B, SDHA, PGK1, ACTB, RPL19; reference genes expressed in all cells). We normalize by subtracting the average \log_2 housekeeping gene expression from the \log_2 endogenous gene expression:

 \log_2 endogenous expression - \log_2 average housekeeping expression = relative expression

The updated CodeSet dimensions are now:

- CS1: OvCa2103_C953
 - Samples = 412
 - Genes = 256
- CS2: PrOTYPE2_v2_C1645
 - Samples = 1223
 - Genes = 365
- CS3: OTTA2014_C2822
 - Samples = 5424
 - Genes = 513

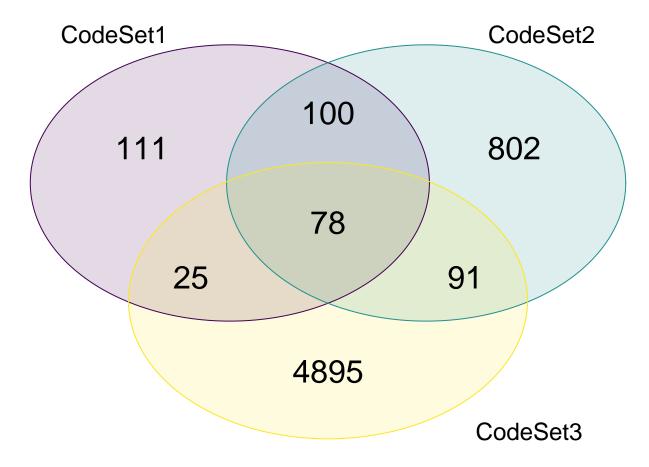

The number of genes are reduced by 19: 5 housekeeping, 8 negative, 6 positive (the latter 2 types are not used).

2.1.3 Common Samples and Genes

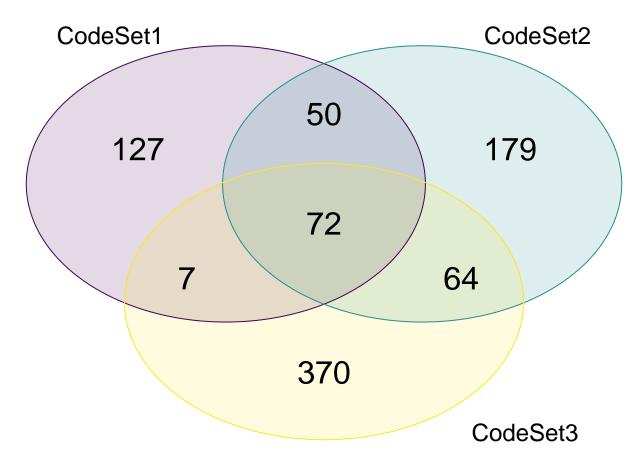

Since the reference pool samples only exist in CS2 and CS3, we need to find an alternative method to normalize all three CodeSets. One method is to select common samples and common genes that exist in all three. We found 72 common genes. Using the summaryID identifier, we also found 78 common summary IDs, translating to 320 samples. The number of samples that were matched to each CodeSet differed:

- CS1: OvCa2103 C953
 - Samples = 93
 - Genes = 72
- CS2: PrOTYPE2 v2 C1645
 - Samples = 87
 - Genes = 72
- CS3: OTTA2014 C2822
 - Samples = 140
 - Genes = 72

2.1.3.1 Overlap of common samples by summary ID

2.1.3.2 Overlap of common genes

^{*}Excluding housekeeping genes and controls

2.1.4 CS1 Training Set Generation

We use the reference method to normalize CS1 to CS3.

• CS1 reference set: duplicate samples from CS1

- Samples = 25
- Genes = 72

• CS3 reference set: corresponding samples in CS3 also found in CS1 reference set

- Samples = 20
- Genes = 72

• CS1 validation set: remaining CS1 samples with reference set removed

- Samples = 387
- Genes = 72

The final CS1 training set has 304 samples on 72 genes after normalization and keeping only the major histotypes of interest.

Table 2.1: Cohort Distribution amongst CodeSets

| cohort | cs1 | cs2 | cs3 |

| POOL-2 | NA | NA | 14 |
| POOL-3 | NA | NA | 13 |
| TNCO | NA | NA | 691 |
| | | | |

2.1.5 CS2 Training Set Generation

We use the pool method to normalize CS2 to CS3 so we can be consistent with the PrOType normalization when there are available pools.

- CS2 pools:
 - Samples = 12 (Pool 1 = 4, Pool 2 = 4, Pool 3 = 4)
 - Genes = 365
- CS3 pools:
 - Samples = 22 (Pool 1 = 12, Pool 2 = 5, Pool 3 = 5)
 - Genes = 513
- CS2 validation set: CS2 samples with pools removed
 - Samples = 1214
 - Genes = 365

The final CS2 training set has 945 samples on 136 (common) genes after normalization and keeping only the major histotypes of interest.

2.1.6 Cohort Distribution

CodeSets comprised samples from sites collected internationally as shown below. Note that the CS3 pools sample total (n=58) shown here include those that are not used as reference pools, following previous normalization methods. In particular, the distribution of CS3 pools actually used for normalization (n=22) is POOL1 = 12, POOL2 = 5, POOL3 = 5.

2.2 Normalization Between CodeSets

After normalization to housekeeping genes and filtering for the five major histotypes of interest, as determined by pathology review and/or IHC, two methods were used to normalize data between CodeSets.

Table 2.2: Distinct Cohort Distribution amongst CodeSets

| cohort | cs1 | cs2 | cs3 |
|-----------|-----|-----|------|
| MAYO | 6 | 62 | NA |
| MTL | 3 | 59 | NA |

| POOL-2 | NA | NA | 5 |
| POOL-3 | NA | NA | 5 |
| TNCO | NA | NA | 674 |
| | | | |

2.2.1 Common Samples Method

The common samples method was used to normalize CodeSet1, 2, and 3, where common samples and genes were used as reference sets. Among the samples repeated in all CodeSets we normalized using either: a random set of 3 samples from each major histotype (random3; n=15), a random set of 2 samples from each major histotype (random2; n=10), or a random set of 1 sample from each major histotype (random1; n=5). In each case CodeSet3 expression (X₃) was held fixed, while CodeSet1/2 expression (X₁ and X₂) were normalized to CodeSet3 by subtracting the average gene expression from the CodeSet1/2 reference set (R₁ or R₂) and adding the average gene expression of the CodeSet3 reference set (R₃). Alternatively, X₁ (norm) = X₁ - R₁ + R₃ would calibrate CodeSet1 to CodeSet3.

2.2.2 Pools Method

The pools method was used to normalize CodeSet2 and CodeSet3. The three reference pools, regularly assayed mixes of samples representing all histotypes, were run in CodeSet2 and CodeSet3 only. CodeSet2 contained 12 reference pool samples (Pool 1 = 4, Pool 2 = 4, Pool 3 = 4) and CodeSet3 contained 22 reference pool samples (Pool 1 = 12, Pool 2 = 5, Pool 3 = 5). Similar to the common samples method, CodeSet2 was normalized to CodeSet3 via: X_2 (norm) = X_2 - R_2 + R_3 where R is the average expression of the reference pool samples in the respective CodeSet. This method of pool normalization was also used by PrOType to classify HGSC subtypes

2.2.3 Concordance Comparison

Concordance between CodeSets using the different normalization strategies was compared in common samples, excluding those used for the normalization, using Pearson's correlation coefficient (R^2), coefficient of accuracy (Ca), and Lin's concordance correlation (R^2 x Ca).

2.3 Histotype Classification

We use 6 classification algorithms and 4 subsampling methods across 500 repetitions in the supervised learning framework for CS1 and CS2. The pipeline was run using many SGE batch jobs as a way of

parallelization on a CentOS 5 server. Implementations of the techniques below were called from the splendid package.

- Classifiers:
 - Random Forest
 - Adaboost
 - XGBoost
 - LDA
 - SVM
 - K-Nearest Neighbours
- Subsampling:
 - None
 - Down-sampling
 - Up-sampling
 - SMOTE

3. Validation

3.1 Full Data Distributions

The histotype distributions on the full data are shown below.

3.2 Training Set Distributions

The training set distributions for CS1 and CS2 are shown below.

3.3 Normalization

Raw Non-Normalized Concordance Measure Distributions

HK genes Normalized Concordance Measure Distributions

3.3.1 Common Samples Method

We employ a new normalization technique using randomly selected samples common to all three CodeSets with a uniform distribution of histotypes as the reference dataset. The number of randomly selected samples ranges from 1-3 per histotype. Hence, the reference dataset has either 5, 10, or 15 samples and we validate on the remaining. Note that ottaID duplicates are collapsed by mean averaging the gene expression. There are n=72 common samples.

CodeSets 1 and 2 are calibrated to CodeSet3 as follows:

- $X^1(norm) = X^1 R^1 + R^3$
- $X^2(norm) = X^2 R^2 + R^3$
- $X^3(norm) = X^3$

3.3.1.1 Random3

Randomly choose 3 samples from each of the 5 histotypes as the reference set (n=15). The rest are validated.

3.3.1.4 Random3 HGSC

Randomly choose n=3 HGSC samples as the reference set, and use the rest as validation. This was tried in lieu of the fact that some non-HGSC histotypes have at most n=3 samples in total, so using Random3 or even Random2 would leave no samples remaining in the validation set for these histotypes.

Random3 HGSC Normalized Concordance Measure Distributions

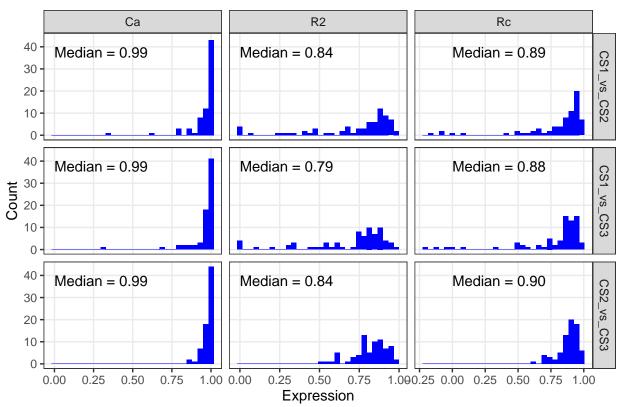

Figure 3.7: Random3 HGSC Normalized Concordance Measure Distributions

In Tables 3.12 and 3.13, we calculate the concordance measures for CS1 vs. CS3 and CS2 cs. CS3, respectively. The measures are calculated for both non-normalized and normalized datasets (CS1, CS2), and split by histotype.

Table 3.13: Random3 HGSC CS2 vs. CS3 Median Concordance Measures by Histotypes

| hist | R2-Non | Ca-Non | Rc-Non | R2-Norm | Ca-Norm | Rc-Norm |
|------|--------|--------|--------|---------|---------|---------|
| CCOC | 0.66 | 0.56 | 0.35 | 0.66 | 0.59 | 0.42 |
| ENOC | 0.85 | 0.76 | 0.66 | 0.85 | 0.85 | 0.76 |
| HGSC | 0.82 | 0.96 | 0.86 | 0.82 | 0.99 | 0.90 |
| LGSC | 0.97 | 0.95 | 0.92 | 0.97 | 0.92 | 0.90 |
| MUC | 0.74 | 0.89 | 0.72 | 0.74 | 0.93 | 0.72 |

3.3.1.5 Random1 for Sites

We use the Random1 method to normalize CS3-USC and CS3-AOC to CS3-VAN. There aren't enough samples in the USC and AOC cohorts to perform Random2 or Random3.

Cross-Site Random1 Non-Normalized Concordance Measure Distributions

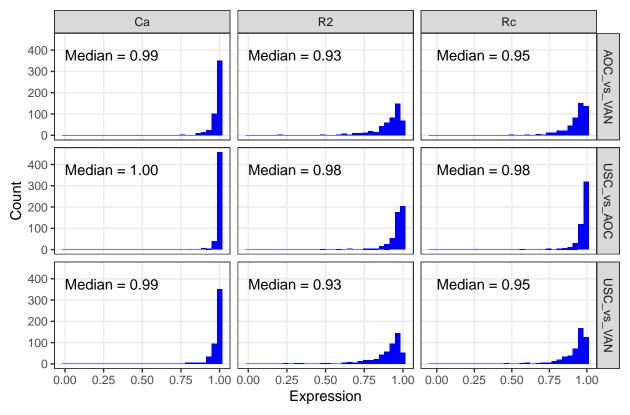

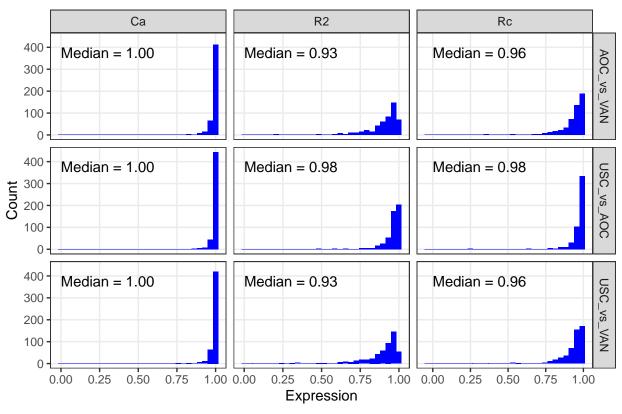

Figure 3.8: Cross-Site Random1 Non-Normalized Concordance Measure Distributions

Cross-Site Random1 Normalized Concordance Measure Distributions

3.3.2 Pools Method

3.3.2.1 CS2 vs. CS3

CodeSet2 contains 12 ref pool samples (Pool 1 = 4, Pool 2 = 4, Pool 3 = 4). CodeSet3 contains 22 ref pool samples (Pool 1 = 12, Pool 2 = 5, Pool 3 = 5). n=84 common samples.

CodeSet2 is calibrated to CodeSet3 as follows:

 $X^2(norm) = X^2 - R^2 + R^3$

 $X^3(norm) = X^3$

CS2Non vs. CS2Pools Concordance Measure Distributions

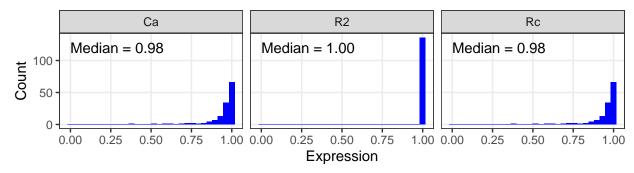

Figure 3.9: CS2Non vs. CS2Pools Concordance Measure Distributions

Table 3.14: Pools Non-Normalized CS2 vs. CS3 Median Concordance Measures by Histotypes

| hist | R2 | Ca | Rc |
|------|------|------|------|
| CCOC | 0.66 | 0.53 | 0.26 |
| ENOC | 0.88 | 0.74 | 0.63 |
| HGSC | 0.77 | 0.94 | 0.80 |
| LGSC | 0.98 | 0.95 | 0.92 |
| MUC | 0.74 | 0.86 | 0.68 |

Table 3.15: Pools Normalized CS2 vs. CS3 Median Concordance Measures by Histotypes

Figure 3.19: AOC vs. VAN Comparisons of Concordance Measure Distributions

3.3.3 Common Samples vs. Pools Comparison

Since only CS2 and CS3 have pools, we make three comparisons between these two CodeSets:

- Non-Normalized
- Common Samples Method
- Pools Method

Table 3.16: Random3 Samples Comparisons Statistics by Histotypes

| hist | R2-Non | Ca-Non | Rc-Non | R2-Common | Ca-Common | Rc-Common | R2-Pools | Ca-Pools | Rc-Pools |
|------|--------|--------|--------|-----------|-----------|-----------|----------|----------|----------|

4. Results

Here we show internal validation summaries for both CS1 and CS2. The accuracy and F1-scores are the measures of interest. Algorithms are sorted by descending value. The point ranges show the median, 5th and 95th percentiles, coloured by subsampling methods.
